**NEW QUESTION: 3**

Assume you would like to receive notification from the container as a stateless session bean transitions to and from the ready state. Which of the following life cycle back annotations would you use? (Choose one.)  
A. @PostConstruct, @PreDestroy, @Remove

- B. @PreConstruct, @PostDestroy
- C. @PostConstruct, @PreDestroy
- D. @PostConstruct, @PostDestroy
- E. @PostConstruct, @PostDestroy, @Remove

**Answer: C**

Explanation:

Explanation/Reference:

The Lifecycle of a Stateless Session Bean

The EJB container typically creates and maintains a pool of stateless session beans, beginning the stateless session bean's lifecycle. The container performs any dependency injection and then invokes the method annotated @PostConstruct, if it exists. The bean is now ready to have its business methods invoked by a client.

At the end of the lifecycle, the EJB container calls the method annotated @PreDestroy, if it exists. The bean's instance is then ready for garbage collection.

Lifecycle of a Stateless Session Bean:

Note: An enterprise bean goes through various stages during its lifetime, or lifecycle. Each type of enterprise bean (stateful session, stateless session, singleton session, or message-driven) has a different lifecycle.
