**NEW QUESTION: 4**

**Answer:**
Explanation:

Explanation

Box 1: B1
B1 (Basic) would minimize cost compared P1v2 (premium) and S1
(standard).
Box 2: Cross Origin Resource Sharing (CORS)
Once you set the CORS rules for the service, then a properly
authenticated request made against the service from a different
domain will be evaluated to determine whether it is allowed
according to the rules you have specified.
Note: CORS (Cross Origin Resource Sharing) is an HTTP feature
that enables a web application running under one domain to
access resources in another domain. In order to reduce the
possibility of cross-site scripting attacks, all modern web
browsers implement a security restriction known as same-origin
policy. This prevents a web page from calling APIs in a
different domain. CORS provides a secure way to allow one
origin (the origin domain) to call APIs in another origin.
