Answer: D

Explanation:

This is an online join and not on perimeter network. Similar to B8

NEW QUESTION: 3

EIGRP is a distance-vector routing protocol that uses hop count as its metric. It is used to route traffic between routers in a network. In a network with multiple paths between two routers, EIGRP will choose the path with the lowest metric. The metric is calculated based on the number of hops between the two routers. In a network with multiple paths between two routers, EIGRP will choose the path with the lowest metric. The metric is calculated based on the number of hops between the two routers.

- A. EIGRP is a distance-vector routing protocol that uses hop count as its metric. It is used to route traffic between routers in a network. In a network with multiple paths between two routers, EIGRP will choose the path with the lowest metric. The metric is calculated based on the number of hops between the two routers.
- B. EIGRP is a distance-vector routing protocol that uses hop count as its metric. It is used to route traffic between routers in a network. In a network with multiple paths between two routers, EIGRP will choose the path with the lowest metric. The metric is calculated based on the number of hops between the two routers.
- C. EIGRP is a distance-vector routing protocol that uses hop count as its metric. It is used to route traffic between routers in a network. In a network with multiple paths between two routers, EIGRP will choose the path with the lowest metric. The metric is calculated based on the number of hops between the two routers.
- D. EIGRP is a distance-vector routing protocol that uses hop count as its metric. It is used to route traffic between routers in a network. In a network with multiple paths between two routers, EIGRP will choose the path with the lowest metric. The metric is calculated based on the number of hops between the two routers.

Answer: B

NEW QUESTION: 4

- A. Option B
- B. Option A
- C. Option D
- D. Option C

Answer: D
