NEW QUESTION: 1

Which of the following is a type of security management for computers and networks in order to identify security breaches?

- A.** EAP
- B.** IDS
- C.** IPS
- D.** ASA

Answer: B

Explanation:

Intrusion detection (ID) is a type of security management system for computers and networks. An ID system gathers and analyzes information from various areas within a computer or a network to identify possible security breaches, which include both intrusions (attacks from outside the organization) and misuse (attacks from within the organization). ID uses vulnerability assessment (sometimes referred to as scanning), which is a technology developed to assess the security of a computer system or network. Intrusion detection functions include the following: Monitoring and analyzing both user and

system activities Analyzing system configurations and vulnerabilities Assessing system and file integrity Ability to recognize patterns typical of attacks Analysis of abnormal activity patterns Tracking user policy violations Answer option B is incorrect. An intrusion prevention system (IPS) is a network security device that monitors network and/or system activities for malicious or unwanted behavior and can react, in real-time, to block or prevent those activities. When an attack is detected, the IPS can drop the offending packets while still allowing all other traffic to pass. Answer option D is incorrect. Adaptive Security Appliance (ASA) is a new generation of network security hardware of Cisco. ASA hardware acts as a firewall, in other security roles, and in a combination of roles. The Cisco ASA includes the following components: Anti-x: Anti-x includes whole class of security tools such as Anti-virus, Anti-spyware, Anti-spam, etc. Intrusion Detection and Prevention: Intrusion Detection and Prevention includes tools such as Intrusion Detection Systems (IDS) and Intrusion Prevention Systems (IPS) for sophisticated kinds of attacks. Note: Earlier Cisco sold firewalls with the proprietary name PIX firewall. ASA is the new edition of security solutions by Cisco. Answer option A is incorrect. Extensible Authentication Protocol, or EAP, is a universal authentication framework frequently used in wireless networks and Point-to-Point connections. It is defined in RFC 3748, which has been updated by RFC 5247. Although the EAP protocol is not limited to wireless LANs and can be used for wired LAN authentication, it is most often used in wireless LANs. The WPA and WPA2 standard has officially adopted five EAP types as its official authentication mechanism. EAP is an authentication framework, not a specific authentication mechanism. The EAP provides some common functions and a negotiation of the desired authentication mechanism.

NEW QUESTION: 4

- A. Option B
- B. Option D
- C. Option A
- D. Option C

Answer: A

Explanation:

4 is the default number of routes that OSPF will include in routing table if more than 4 equal cost routes exist for the same subnet. However, OSPF can include up to 16 equal cost routes in the routing table and perform load balancing amongst them. In order to configure this feature, you need to use the OSPF subcommand maximum-paths, i.e. maximum-paths 16.
