NEW QUESTION: 1
An enterprise wants data backup to consume only a small amount of storage space and a minimal backup window. In this case, which backup type is most recommended?
A. Full backup
B. Full backup + Differential incremental backup
C. Cumulative incremental backup + Differential incremental backup
D. Full backup + Cumulative incremental backup
Answer: B

NEW QUESTION: 2
Scenario:
You have been brought in to troubleshoot an EIGRP network. You have resolved the initial issue between routers R2 and R4, but another issue remains. You are to locate the problem and suggest solution to resolve the issue.
The customer has disabled access to the show running-config command.

The network segment between R2 and R4 has become disconnected from the remainder of the network. How should this issue be resolved?
A. Enable the R2 and R4 router interfaces connected to the 192.168.24.0 network.
B. Remove the distribute-list command from the EIGRP 200 routing process in R2.
C. Remove the distribute-list command from the EIGRP 100 routing process in R2.
D. Move the 192.168.24.0 network to the EIGRP 1 routing process in R2 and R4.
E. Change the autonomous system number in the remainder of the network to be consistent with R2 and R4.
Answer: D
Explanation:
Explanation
When issuing the "show ip eigrp neighbor" command (which is about the only command that it lets you do in this question) you will see that all other routers are configured for EIGRP AS 1. However, the 192.16824.0 network between R2 and R4 is incorrectly configured for EIGRP AS 100:

NEW QUESTION: 4
A user has enabled the Multi AZ feature with the MS SQL RDS
database server.
Which of the below mentioned statements will help the user
understand the Multi AZ feature better?
A. In a Multi AZ, AWS runs just one DB but copies the data
synchronously to the standby replica
B. In a Multi AZ, AWS runs two DBs in parallel and copies the
data synchronously to the replica copy
C. In a Multi AZ, AWS runs two DBs in parallel and copies the
data asynchronously to the replica copy
D. AWS MS SQL does not support the Multi AZ feature
Answer: A
Explanation:
Amazon RDS provides high availability and failover support for
DB instances using Multi-AZ deployments. In a Multi-AZ
deployment, Amazon RDS automatically provisions and maintains a
synchronous standby replica in a different Availability Zone.
The primary DB instance is synchronously replicated across
Availability Zones to a standby replica to provide data
redundancy, eliminate I/O freezes, and minimize latency spikes
during system backups. Running a DB instance with high
availability can enhance availability during planned system
maintenance, and help protect your databases against DB
instance failure and Availability Zone disruption.Note that the
high-availability feature is not a scaling solution for
read-only scenarios; you cannot use a standby replica to serve
read traffic. To service read-only traffic, you should use a
read replica.
