NEW QUESTION: 1

Your network consists of one Active Directory forest that contains one root domain and 10 child domains. Administrators of the child domains frequently modify the

records for authoritative DNS servers for the child domain DNS zones.

You need to recommend a solution to minimize the amount of manual configuration steps required to maintain name resolution on the network.

What should you recommend?

A. On the child domain DNS servers, create stub zones for the root domain zone.

B. On the root domain DNS servers, configure delegation subdomain records for the child domains.

C. On the child domain DNS servers, configure conditional forwarders for the parent domain.

D. On the root domain DNS servers, create stub zones for the child domain zones.

Answer: D

Explanation:

Explanation/Reference:

To implement a solution that would minimize the effort required to maintain name resolution on the network, you need to create stub zones for the child domain zones on the root domain DNS servers. Stub zones can help reduce the amount of DNS traffic on your network by streamlining name resolution and zone replication. The Stub zone should be configured for the child domain zones on the root domain DNS servers and not vice versa because a stub zone is like a secondary zone that obtains its resource records from other name servers (one or more master name servers).

NEW QUESTION: 2

You are implementing a package management solution for a Node.js application by using Azure Artifacts.

You need to configure the development environment to connect to the package repository. The solution must minimize the likelihood that credentials will be leaked.

Which file should you use to configure each connection? To answer, drag the appropriate files to the correct connections. Each file may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content NOTE: Each correct selection is worth one point.

Answer:

Explanation:

Explanation

All Azure Artifacts feeds require authentication, so you'll need to store credentials for the feed before you can install or publish packages. npm uses .npmrc configuration files to

store feed URLs and credentials. Azure DevOps Services recommends using two .npmrc files.

Feed registry information: The .npmrc file in the project One .npmrc should live at the root of your git repo adjacent to your project's package.json. It should contain a "registry" line for your feed and it should not contain credentials since it will be checked into git.

Credentials: The .npmrc file in the user's home folder On your development machine, you will also have a .npmrc in \$home for Linux or Mac systems or \$env.HOME for win systems. This .npmrc should contain credentials for all of the registries that you need to connect to. The NPM client will look at your project's .npmrc, discover the registry, and fetch matching credentials from \$home/.npmrc or \$env.HOME/.npmrc.
