### **NEW QUESTION: 3**

What is a disadvantage of using aggressive mode instead of main mode for ISAKMP/IPsec establishment?

- A. It does not use Diffie-Hellman for secret exchange.
- B. It does not support NAT traversal.
- C. It does not hide the identity of the peer.
- D. It does not support dead peer detection.

**Answer: C**

Explanation:

IKE phase 1's purpose is to establish a secure authenticated communication channel by using the Diffie-Hellman key exchange algorithm to generate a shared secret key to encrypt further IKE communications. This negotiation results in one single bi-directional ISAKMP Security Association (SA). The authentication can be performed using either pre-shared key (shared secret), signatures, or public key encryption. Phase 1 operates in either Main Mode or Aggressive Mode.

Main Mode protects the identity of the peers; Aggressive Mode does not.
