NEW QUESTION: 1
Which directory holds the SmartLog index files by default?
A. $SMARTLOGDIR/data
B. $SMARTLOG/dir
C. $FWDIR/log
D. $FWDIR/smartlog
Answer: A

NEW QUESTION: 2
The best method you have to tell whether you are doing good
rescue breathing is to:
A. see the pupils of the victim's eyes become very wide
B. see the chest rise and fall with each breath
C. see the skin color change to a "blue, mottled" pattern
during rescue breathing
D. feel the pulse return
Answer: B
Explanation:
Seeing the chest actually rise with rescue breathing is an
excellent sign that a significant volume of air is entering the
lungs (and not the stomach).
The answer b is incorrect. A blue color with "mottling" is the
opposite of what you would expect with good rescue breathing.
Answer a is actually a bad sign and indicates damage to the
brain, from no blood flow.
Answer b indicates good return of blood flow. Good rescue
breathing will, indeed, contribute to the return of blood flow.
Feeling a pulse return is the best way to tell that an AED
defibrillation shock has been effective; pulse return is not
the best method to tell whether you are doing good rescue
breathing.

NEW QUESTION: 3
Your company manages on-premises Microsoft SQL Server pipelines
by using a custom solution.
The data engineering team must implement a process to pull data
from SQL Server and migrate it to Azure Blob storage. The
process must orchestrate and manage the data lifecycle.
You need to configure Azure Data Factory to connect to the
on-premises SQL Server database.
Which three actions should you perform in sequence? To answer,
move the appropriate actions from the list of actions to the
answer area and arrange them in the correct order.

Answer:
Explanation:

Explanation:
Step 1: Create a virtual private network (VPN) connection from
on-premises to Microsoft Azure.
You can also use IPSec VPN or Azure ExpressRoute to further
secure the communication channel between your on-premises
network and Azure.
Azure Virtual Network is a logical representation of your
network in the cloud. You can connect an on-premises network to
your virtual network by setting up IPSec VPN (site-to-site) or
ExpressRoute (private peering).
Step 2: Create an Azure Data Factory resource.
Step 3: Configure a self-hosted integration runtime.

You create a self-hosted integration runtime and associate it with an on-premises machine with the SQL Server database. The self-hosted integration runtime is the component that copies data from the SQL Server database on your machine to Azure Blob storage.
Note: A self-hosted integration runtime can run copy activities between a cloud data store and a data store in a private network, and it can dispatch transform activities against compute resources in an on-premises network or an Azure virtual network. The installation of a self-hosted integration runtime needs on an on-premises machine or a virtual machine (VM) inside a private network.
