NEW QUESTION: 1

Which description of the Diffie-Hellman protocol is true?

- A.** It provides a way for two peers to establish a shared-secret key, which only they will know, even though they are communicating over an unsecured channel.
- B.** It uses symmetrical encryption to provide data confidentiality over an unsecured communications channel.
- C.** It is used within the IKE Phase 1 exchange to provide peer authentication.
- D.** It uses asymmetrical encryption to provide authentication over an unsecured communications channel.
- E.** It is a data integrity algorithm that is used within the IKE

exchanges to guarantee the integrity of the message of the IKE exchanges.

Answer: A

NEW QUESTION: 2

You have been asked to install and configure a new switch in a customer network. Use the console access to the existing and new switches to configure and verify correct device configuration.

You are connecting the New_Switch to the LAN topology; the switch has been partially configured and you need to complete the rest of configuration to enable PC1 communication with PC2. Which of the configuration is correct?

- A. Option C
- B. Option D
- C. Option E
- D. Option A
- E. Option B

Answer: B

Explanation:

Within any VTP, the VTP domain name must match. So, step one is to find the correct VTP name on the other switches. Logging in to SW1 and using the "show vtp status" command we see this:

So we know that the VTP domain must be CCNP. This leaves only choice D and E.

We also see from the topology diagram that eth 0/0 of the new switch connects to a PC in VLNA 100, so we know that this port must be an access port in VLAN 100, leaving only choice D as correct. Note that the VTP versions supported in this network are 1, 2, 3 so either VTP version 2 or 3 can be configured on the new switch.

NEW QUESTION: 3
