NEW QUESTION: 1

Refer to the exhibit. Communication between London and New York is down. Which command set must be applied to the NewYork switch to resolve the issue?

- A. Option A
- B. Option D
- C. Option C
- D. Option B

Answer: B

NEW QUESTION: 2

Which of the following NAT firewall translation modes offers no protection from hacking attacks to an internal host using this functionality?

- A. Static translation
- B. Dynamic translation
- C. Network redundancy translation
- D. Load balancing translation

Answer: A

Explanation:

Static translation (also called port forwarding), assigns a fixed address to a specific internal network resource (usually a server).

Static NAT is required to make internal hosts available for connection from external hosts.

It merely replaces port information on a one-to-one basis. This affords no protection to statistically translated hosts: hacking attacks will be just as efficiently translated as any other valid connection attempt.

NOTE FROM CLEMENT:

Hiding Nat or Overloaded Nat is when you have a group of users behind a unique public IP address. This will provide you with some security through obscurity where an attacker scanning your network would see the unique IP address on the outside of the gateway but could not tell if there is one user, ten users, or hundreds of users behind that IP.

NAT was NEVER built as a security mechanism.

In the case of Static NAT used for some of your servers for example, your web server private IP is map to a valid external public IP on a one on one basis, your SMTP server private IP is mapped to a static public IP, and so on.

If an attacker scan the IP address range on the external side of the gateway he would discover every single one of your servers or any other hosts using static natting. Ports that are open, services that are listening, and all of this info could be

gathered just as if the server was in fact using a public IP. It does not provide this security through obscurity mentioned above.

All of the other answer are incorrect.

NEW QUESTION: 3

DRAG DROP

Your network contains an Active Directory domain named contoso.com. The domain contains two servers named Server1 and Server3. The network contains a standalone server named Server2.

All servers run Windows Server 2012 R2. The servers are configured as shown in the following table.

Server3 hosts an application named App1. App1 is accessible internally by using the URL https://app1.contoso.com. App1 only supports Integrated Windows authentication.

You need to ensure that all users from the Internet are pre-authenticated before they can access App1.

What should you do?

To answer, drag the appropriate servers to the correct actions. Each server may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

Answer:

Explanation:

Box 1: Server1

For all types of application that you can publish using AD FS preauthentication, you must

add a AD FS relying party trust to the Federation Service.

Use Server1 as it has AD FS.

Box 2: Server2

When publishing applications that use Integrated Windows authentication, the Web

Application Proxy server uses Kerberos constrained delegation to authenticate users to the published application.

Box 3: Server2

To publish a claims-based application

1.On the Web Application Proxy server, in the Remote Access Management console, in the Navigation pane, click Web

Application Proxy, and then in the Tasks pane, click Publish.

2.On the Publish New Application Wizard, on the Welcome page, click Next. Etc.

Box 4: Server2 Configure CAs and certificates (see c below)
Web Application Proxy servers require the following certificates in the certificate store on each Web Application Proxy server: a) A certificate whose subject covers the federation service name. If you want to use Workplace Join, the certificate must also contain the following subject alternative names (SANs): <federation service name>. <domain> and enterpriseregistration.<domain>. b) A wildcard certificate, a subject alternative name (SAN) certificate, several SAN certificates, or several certificates whose subjects cover each web application. c) A copy of the certificate issued to external servers when using client certificate preauthentication.
