Especially for Tableau Desktop Specialist, If you are experiencing a technical problem on the system, the staff at TDS-C01 practice guide will also perform one-on-one services for you.

Easy To Use Tableau Product.

#### NEW QUESTION: 1

Which of the following is the most common data format for information exchange within a federated environment?

- A. JSON
- B. HTML
- C. XML
- D. SAML

**Answer: D**

Explanation:

Security Assertion Markup Language (SAML) is the most common data format for information exchange within a federated

identity system. It is used to transmit and exchange authentication and authorization data. XML is similar to SAML, but it's used for general-purpose data encoding and labeling and is not used for the exchange of authentication and authorization data in the way that SAML is for federated systems.

JSON is used similarly to XML, as a text-based data exchange format that typically uses attribute-value pairings, but it's not used for authentication and authorization exchange. HTML is used only for encoding web pages for web browsers and is not used for data exchange--and certainly not in a federated system.

### **NEW QUESTION: 2**

Review the storage pool information:

Which statement describes the status of this storage pool?

- A.** It is a double-parity RAIDZ storage pool and can withstand two disk failures; data will be striped across four disk components.
- B.** It is an improperly configured RAIDZ storage pool; data will be striped across four disk components, but only three drives are protected with redundancy.
- C.** It is an improperly configured RAIDZ storage pool; data will be striped across three disk components, but only three drives are protected with redundancy.
- D.** It is a RAIDZ storage pool and can withstand a single disk failure; data will be striped at: disk components.

#### **Answer: C**

Explanation:

Device c3t6d0 is not included in the RAIDZ storage pool. The other three devices are included in the raidz pool. The data on these devices are protected.

Note: In addition to a mirrored storage pool configuration, ZFS provides a RAID-Z configuration with either single, double, or triple parity fault tolerance. Single-parity RAID-Z (raidz or raidz1) is similar to RAID-5. Double-parity RAID-Z (raidz2) is similar to RAID-6.

Reference: RAID-Z Storage Pool Configuration

### **NEW QUESTION: 3**

HOTSPOT

#### **Answer:**

Explanation:

Target 1: noStore="false"

The page that has the OutputCacheProfile.NoStore property set to true issues a response specifying in its header to prevent secondary storage of sensitive information.

Target 2: VaryByParam ="clinicID"

The VaryByParam is a semicolon-delimited set of parameters used to vary the cached output. It allows varying the cached output by GET query string or form POST parameters. For instance, you can vary the user-control output to the cache by specifying the user-control name along with either a query string or a form POST parameter.

Incorrect: Not varyByControl="ClinicID"

The VaryByControl is a semicolon-delimited set of IDs of controls to be cached.

Target 3: duration=129600"

The Duration represents the time in seconds that the page or user control is cached. Setting this property establishes an expiration policy for HTTP responses from the page or control to which it applies and will automatically cause the caching of their output.

129600 seconds is 36 hours (60\*60\*36).
